Derwent Abstract

**DERWENT  
RECORD**

(**DE19843109A**) **Novelty** - Molten- or sheet thermoplastic contacts a non-adherent, variable-temperature pitted molding surface (5), texturing it. Numerous blind holes are part filled. Mechanical pressure compresses cavity volumes remaining, filling the matrix but leaving the cavities only part-filled by thermoplastic. Still against the surface, the plastic is cooled and set, to retain the molded texturing. Pressure is released and trapped compressed air forces the plastic texture out. The set plastic is drawn from the surface as a textured sheet. Plastic introduced into the cavities and derived from the material, forms a nap comprising projections and burls.  
**Detailed Description** - INDEPENDENT CLAIMS are included for machinery carrying out the process, and the product obtained.  
**Use** - Cited examples of products, include a textile backing sheet for use in hygiene applications and an insert for covering materials used in the furniture industry. Various coating, impregnation, perforation and printing processes can be applied. A grained finish and various textile backings can be applied.  
**Advantage** - The method textures in continuous production, without

separating material into the fine cavities of the texture-producing roller, or variation in the product. Internal overpressures of 2-5 bar are set up, so that whilst the matrix is filled, the cavities are only part-filled. This is useful, because when the pressure is removed, the compressed air helps force the thermoplastic out of the cavities again. The fine texture produced remains attached to the body of the material. The roller initially producing the texturing is PTFE, with a suitably-textured surface.
